System Features

FUNCTIONALITY

Unique to the market, the system weight is carried on the bottom track. This system uses gravity as an ally, adding functionality and security. With an average project weight of 400kgs a bottom supported system is far better and safer than a top-hung system.

RELIABILITY

No wheels, no bearings and no rollers of any kind. All panels smooth slide resulting in a very reliable and a very low maintenance system.

SIMPLE QUALITY

Only first quality materials are used in our system. Compared to other systems, we use far less plastic-based components. Components are kept to a minimum, using fewer than any other system. Our parts are durable, corrosion-resistance and long-lasting.

WATER RESISTANCE

Our system provides optimum water resistance as there are no plastic gaskets between profile joints. Components assembled with aluminium to aluminium joints to prevent water and wind getting in. Furthermore, the water resistance of our system is improved by being bottom weighted.

SECURITY & RELIABILITY WITH BEAUTY

Security and reliability play a key role in the design and development of the product. We pay special attention to its aesthetic beauty, giving the system a soft, rounded profile and line unique to the market. The result is the most advanced technology, beauty, design and function.

STRENGTH

The panels are joined by solid metal pieces to guarantee security, protection and isolation against the wind and rain.

WITH OR WITHOUT ARMS

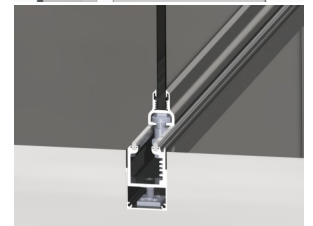

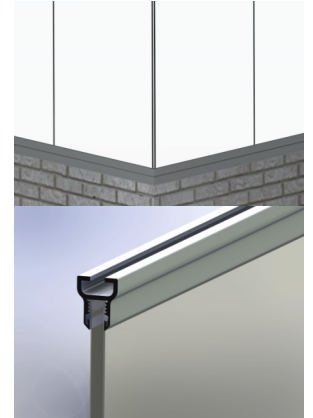

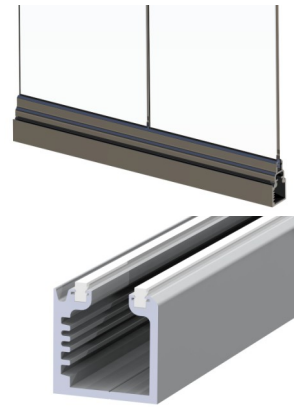

You can choose between a configuration with or without an opening arm. The last option provides a clean aesthetic and allows an easy installation of curtains or blinds.

SECURE LOCK

Any standard locking solution can be used with this system, adding security and letting you choose between a wide range of possibilities with or without key.

COMPENSATOR CHANNEL (EASY LEVELING PROFILE)

This system can be completely recessed into the floor as well in a very clean and secure way. With the easy levelling profile it is possible to adjust the system height
