

# Create open Space

## Innovative glass sliding wall system for interior and outdoor applications

The independently moveable panels made from toughened safety glass offer enormous flexibility and can be folded away to either side, taking up very little room. As there are no vertical profiles you have a wonderful uninterrupted view of the world outside.

This patented system, slides on the lower rail and is not suspended, and thus we are able to use the most discrete upper and lower profiles.

### The ideal commercial solution!

Why not make year-round use of your café/restaurant terrace by installing sliding glass panels?

Sliding glass panels can seal off balconies when building works are being carried out and will offer added value to these spaces in the future.

#### Features:

- Slides on the lower rail
- No vertical profiles
- Not suspended
- Very flexible opening
- The standard design offers a glass door handle and a ventilation position

The weight of the entire system rests on the lower profile. The average weight of any system is 400 kg, the weight of a roof. Our unique system means this is supported from below and is thus far more reliable.

#### SPACE SAVING

The individual panels fold back when opened at an angle of 90°, and once opened take up only 40 mm of space per panel. The option is also available to have no upper arm which allows for easier installation of window furnishings.

#### SOUND DESIGN

Each panel has patented special internal metal runners which guarantee a perfectly smooth action and safe seal, also ensuring excellent insulation against wind and water.

#### RELIABLE

The Sliding Glass system has no rolling components. The panels glide silently along the lower rail. Due to this there is far less annual maintenance required and the system is far more reliable.

#### AESTHETIC

The profiles have a very elegant design and are the smallest on the market. These profiles have been developed using the latest technology and make use of top quality materials. The design is unique.

#### HANDLES/LOCKS

A variety of handles and locks are available. These vary from a very discrete glass knob to a secure cylinder lock. These can be locked from only the inside or inside and outside.

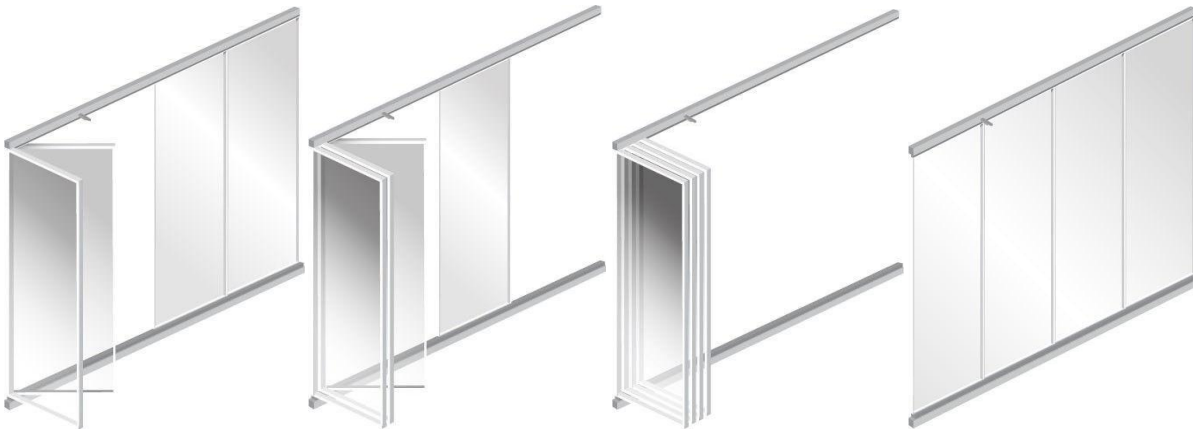

#### DESIGN

Sliding glass can be used in practically all building applications. The system allows the panels to turn up to a maximum angle of 90° allowing the set of panels to be neatly drawn back to one side.

Pergola, corner terraces and balcony enclosures, the possibilities are endless.

## INSTALLATION

The levelling profile makes allowances for differences in the floor level of up to 25 mm. This can be installed during the floor construction phase. A unique feature is that the lower rail of our sliding glass system can be built into the floor surface.

## Glass:

Toughened safety glass, standard **10 mm** thickness

## Door and locking systems:

The door can turn inwards, inwards and outwards, or just outwards. A handle can be fitted, with a latch and cylinder lock mounted on the door panel.
